AH1802
MICROPOWER, ULTRA-SENSITIVE OMNIPOLAR HALL-EFFECT SENSOR SWITCH

## Description

The AH1802 is a high-sensitivity, micropower, omnipolar Hall Effect switch integrated circuit (IC) designed for portable and battery-powered equipment, such as cellular phones, PDAs, and portable PCs. Based on two sensitive Hall Effect plates and a chopper-stabilized architecture, the AH1802 provides a reliable solution over the whole operating range. To support portable and battery-powered equipment, the design has been optimized to operate over the supply range of 2.5 V to 5.5 V and consumes only $24 \mu \mathrm{~W}$ with a supply of 3 V .

The single open-drain output can be switched on with either a north or south pole of sufficient strength. When the magnetic flux density (B) perpendicular to the part marking surface is larger than operate point (Bop), the output is switched on (pulled low). The output is turned off when $B$ becomes lower than the release point (Brp). The output remains off when there is no magnetic field.

Notes: 6. Stresses greater than the 'Absolute Maximum Ratings' specified above may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions exceeding those indicated in this specification is not implied. Device reliability may be affected by exposure to absolute maximum rating conditions for extended periods of time.
7. The absolute maximum $V_{D D}$ of 7 V is a transient stress rating and is not meant as a functional operating condition. It is not recommended to operate the device at the absolute maximum rated conditions for any period of time.
